Question 1

Complete

Mark 1.00 out of 1.00

What is the Sleeper Effect?

Select one:

- ☒ People will only remember the content of a message after some time has passed but forget the source and its trustworthiness.
- ☐ After some time passes people start to add information to the original story they were told.
- ☐ People are often tired after taking a nap, this is a manipulation of our body.
- ☐ If you study for an exam directly before sleep you are better at remembering the information the next day.

Question 2

Complete

Mark 1.00 out of 1.00

What did the famous eyewitness-testimony experiment by Loftus & Palmer (1974) reveal?

Select one:

- ☐ Their study showed that participants were more aggressive after a car accident.
- ☐ Their study showed that participants got in more accidents than they could remember.
- ☒ Their study showed that the language of questions participants were asked after they saw a car accident, was able to alter participants' memory of the car accident.
- ☐ Their study showed that the language of questions participants were asked after they saw a car accident, was not able to alter participants' memory of the car accident.

Question 3

What are the main assumptions of the Uncanny Valley Hypothesis? What practical advice did its originator, Masahiro Mori, provide back in 1970? And what could this suggest for the design of AI systems?

The Uncanny Valley Hypothesis assumes that, up to a certain point, making robots more human-alike makes them more agreeable. Trying to make robots more human-alike, after this point, makes them eerie. Masahiro Mori suggested that robot manufacturers should not try to create robots which look exactly human-alike.

For the design of AI systems, this means that the attempt to make robots look like human in order to increase their likability and make them look/feel familiar, is a failed attempt. In fact, it would lead to negative effects. It's worth mentioning that if robots are indistinguishable from humans, an ethical question of whether this is allowable arises. The EU Council on AI is of the opinion that AI systems should distinguishable from human beings.

Question 4

Complete

Mark 1.00 out of 1.00

Can Virtual Reality help patients with phantom limb pain?

Select one:

- ☒ Yes, it works similar to the well-established Mirror Therapy.
- ☐ No, it has been shown that Virtual Reality functions still need to be improved to help such patients.
- ☐ No, it has been shown that patients with phantom limb pain feel even more stressed when using Virtual Reality.
- ☐ Yes, patients feel less pain when they can focus on any video game in VR.

Question 5

Complete

Mark 1.00 out of 1.00

Which of the following systems does **not** belong to Somatosensation?

Select one:

- ☐ Nociception
- ☒ Gustation
- ☐ Proprioception
- ☐ Hapsis

Question 6

Complete

Mark 1.00 out of 1.00

Which of the following statements about human Short-Term Memory (STM) is FALSE?

Select one:

- ☐ STM has a capacity of 7 ± 2 .
- ☐ STM has a limited capacity.
- ☐ Short-term memories are quick to learn.
- ☒ Short-term memories are slow to forget.

Question 7

Complete

Mark 1.00 out of 1.00

The Technology Acceptance Model (TAM, Davis, 1989) is one of the most widely used research models to predict technology adoption by new users. Which statement about the TAM is CORRECT?

Select one:

- ☐ The TAM has a strong focus on cultural differences, e.g. differences in technology acceptance between Western and Eastern countries.
- ☐ The TAM has a strong focus on the adoption of new healthcare applications, e.g. nursing robots.
- ☐ According to TAM, factors such as stimulation and brand identification determine the user acceptance of a technology.
- ☒ According to TAM, factors such as ease of use and perceived usefulness determine the user acceptance of a technology.

Question 8

Complete

Mark 1.00 out of 1.00

Let's talk about trust. Which of the following statements is FALSE?

Select one:

- ☐ Without being vulnerable or at risk, the concept of trust is rather irrelevant.
- ☐ Once affective trust is established, a trustor-trustee relationship may become less transparent for objective risk assessments.
- ☒ At the market launch of an AI system, when there is still little practical experience with it, no individual differences in how much users trust the system are expected.
- ☐ If an AI system appears competent and reliable, important requirements for the establishment of cognitive trust are met.

Question 9

Complete

Marked out of 4.00

In one of the lectures we discussed the priming effect. Please provide a definition of the priming effect and give a practical example of how the priming effect works.

Priming effect is how the introduction of a stimuli leads to a certain behavior.

The example provided in the lecture was showing various pictures of things that could make us think of milk. Afterwards, the question of "what do cows drink?" was introduced. Due to the priming effect (the stimulus here being the pictures leading to the question), people sometimes answer "milk" which they probably wouldn't have said if for the stimulus.

Question 10

Marked out of 4.00

Briefly describe the three Basic Psychological Needs and name the theory from which they are derived. Discuss on the example of one of these needs, how AI may threaten it or even help to fulfill it.

The Self-Determination Theory introduced the three Basic Psychological Needs. The satisfaction of all three needs together is needed for a motivation to be autonomous.

- **Autonomy:** is the experience of willingness. The satisfaction of this need leads to a feeling of integrity. The frustration of this need leads to a feeling of pressure.
- **Competence:** is the experience of effectiveness and mastery. The satisfaction of this need leads to increased indulgence in experiences which increases our skills and effectiveness. On the other hand, the frustration of this need leads to a feeling of ineffectiveness and helplessness.
- (The name just disappeared from my mind): is the experience of warmth and belonging. The satisfaction of this need is by inclusion and belonging. If frustrated, it leads to social alienation and loneliness.

As an example of the autonomy task, robots assisting the elderly might fulfill the task by basically following the orders and desires of the elderly. It might lead to threatening it for instance in recruiting algorithms if the final decision lies within the algorithm and is not interpretable.

Question 11

Complete

Mark 1.00 out of 1.00

The Scandinavian project "Q" aims to reduce gender bias in AI assistants by ...

- ☐ ... increasing the proportion of female developers of such assistants.
- ☒ ... developing a gender-neutral synthetic voice.
- ☐ ... avoiding speech interaction with such assistants.
- ☐ ... controlling training data for such biases.

Question 12

Complete

Mark 0.00 out of 1.00

The research literature on Computer Anxiety speaks a clear language. People who have less computer anxiety than others are usually ...

Select one:

- ☐ better educated about technology.
- ☒ more self-confident.
- ☐ younger than 45 years.
- ☐ grown up in Asia.

Question 13

Complete

Mark 1.00 out of 1.00

What are two philosophical theories of consciousness that concern the Mind-Body Problem?

Select one:

- ☒ Monism and Dualism
- ☐ Monotheism and Dualism
- ☐ Practicalism and Monotheism
- ☐ Monism and Theoretica

Question 14

Complete

Mark 1.00 out of 1.00

What is Psychology?

- ☐ A sub-discipline of medicine.
- ☐ The observation-based analysis of the human mind.
- ☐ A sub-discipline of philosophy.
- ☒ The study of human mind and human behavior.

Question 15

Complete

Mark 1.00 out of 1.00

Which research design is used in Psychology, but also in numerous other domains, to investigate cause-effect relationships (e.g., the effect of a particular light signal on the understandability of a robot)?

Select one:

- ☐ Cross-sectional survey
- ☐ Correlational study
- ☐ Theoretical review
- ☒ Randomized experiment

Question 16

Complete

Mark 1.00 out of 1.00

What effect is described as the "Midas Touch"?

- ☐ Students who were touched on the shoulder by a peer show less exam anxiety.
- ☐ Students who were lightly touched by a woman of color exhibit less unconscious racism.
- ☒ Waitresses who lightly touch their customers receive more tips.
- ☐ In a competitive situation, a touch on the shoulder is perceived as sign of dominance.

Question 17

Complete

Mark 1.00 out of 1.00

How are faces processed by humans?

Select one:

- ☐ First the lower face half, then the upper face half.
- ☐ First the upper face half, then the lower face half.
- ☒ Holistically.
- ☐ First the mouth region and at last the region around the nose.
